

How To Keep An Emulsion Polished Floor In Top Condition By The Process Of Spray Cleaning Regularly

The machine for doing this needs to be a high speed machine of at least 300 revolutions per minute. An ultra high speed machine of 1000rpm or more gives superb `results but can only be used in a straight line, whereas a lower speed machine is more manoeuvrable, in smaller areas, which is more practical.

The principle that makes this possible is the amount you spray. A small amount, like mist, is enough (so the floor is not wet). Therefore the speed of the machine dries the pad quickly so, besides removing the top dirt, it starts to buff up the floor. After using the red pad a white super buff pad can enhance the floor shine. A floor maintainer is the recommended cleaner in the correct dilution.

The pad on the normal high speed machines are usually red or maroon but on the ultra high speed they are manufactured differently and therefore, because of the speed, can give problems as the heat generated by the speed can cause burns on the surface.

Use this method to maintain the floor appearance.
